

360° AND ProARC BUILT ON SHAREPOINT 2010 AND OFFICE 2010

Built on the Office 2010 and SharePoint 2010 platform, 360° and ProArc are unique applications for information and document management, with collaboration and productivity closely linked to an improved user experience.

An ever-increasing volume of documents, email and other data is created, amended, saved and shared on a daily basis within organisations. At the same time, internal and external demands for productivity, quality and compliance are becoming stricter. We are in the process of creating the workplace for the next generation, where the focus on collaboration, flexibility, user experience and efficiency is becoming ever more important. This requires intelligent, future-proof applications that support each organisation's changing needs.

SharePoint: the most prevalent platform

Over the past years, SharePoint has become the most widely used platform for electronic collaboration within and between organisations. The launch of SharePoint 2010 sees a further stage in the development of the platform as an even more efficient tool for collaboration and the exchange of information. The integration with Microsoft Office has become even more seamless, the user interfaces more coordinated and a number of new opportunities have arisen, such as for co-authoring simultaneous writing of documents and editing directly in a web browser. SharePoint 2010 reduces the gap between Internet, Extranet and Intranet through better support for offline and mobile access to documents and information as well as functions for social media within organisations.

A new standard

Software Innovation has been using SharePoint as a successful development platform for 360° and ProArc since 2007. The combination of SharePoint collaborative technology with the functionalities of 360° and ProArc that allow for efficient and compliant Case & Document Management has set a new standard in the market. The launch of SharePoint 2010 and Office 2010 sees a further improvement of the ProArc and 360° applications, with new versions still to be launched in 2010.

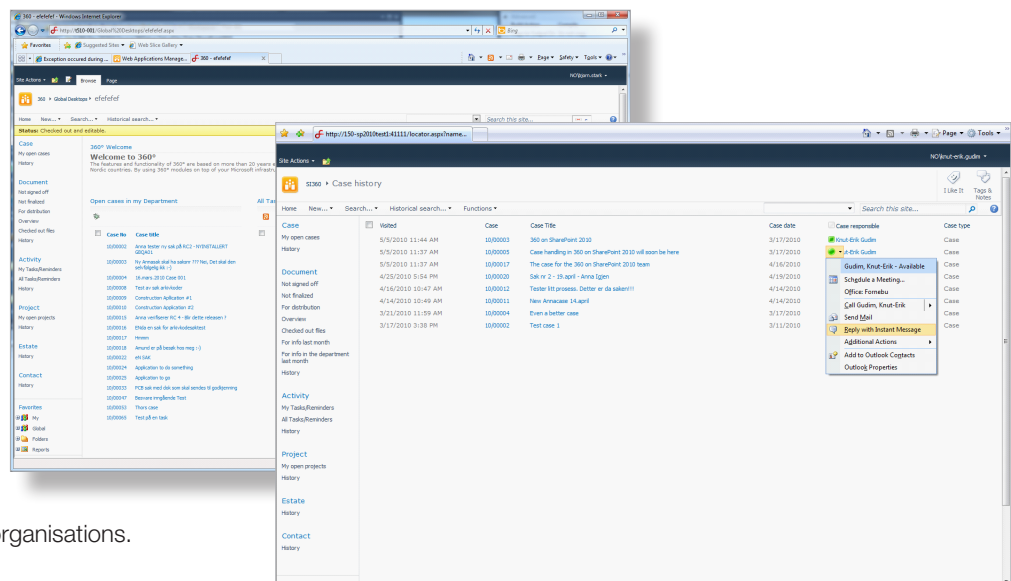

Maintaining Investments

Software Innovation has demonstrated to existing customers that previous investments are maintained and continue to grow. 360° and ProArc for SharePoint 2010 are completely compatible with the previous versions; you will have complete functionality immediately, data conversion is not necessary and specific configurations will continue to work without having to be re-written. This demonstrates clearly the advantages of professional standard applications over client-specific application development.

New opportunities in Office 2010

SharePoint 2010 and Office 2010 bring further possibilities for Software Innovation's customers. Office documents can be viewed and edited from "wherever you are" directly from a web browser through Office Web Apps- without having to access the usual Office programmes - while SharePoint Workspace allows you to take documents offline for viewing or editing, with subsequent automatic synchronisation.

The close integration of Office 2010, SharePoint 2010 and 360°/ ProArc also creates the possibility for a group of colleagues to work simultaneously on a document through the

functionality called "co-authoring". Users will benefit from a more unified user experience within SharePoint and Office through the introduction of "ribbons" in SharePoint. Finally, SharePoint's search engine FAST and the capacity for integrating 360° and ProArc information into this type of search allows archived documents and case information to be more accessible.

360° AND PROARC BUILT ON SHAREPOINT 2010 AND OFFICE 2010

New opportunities in SharePoint 2010

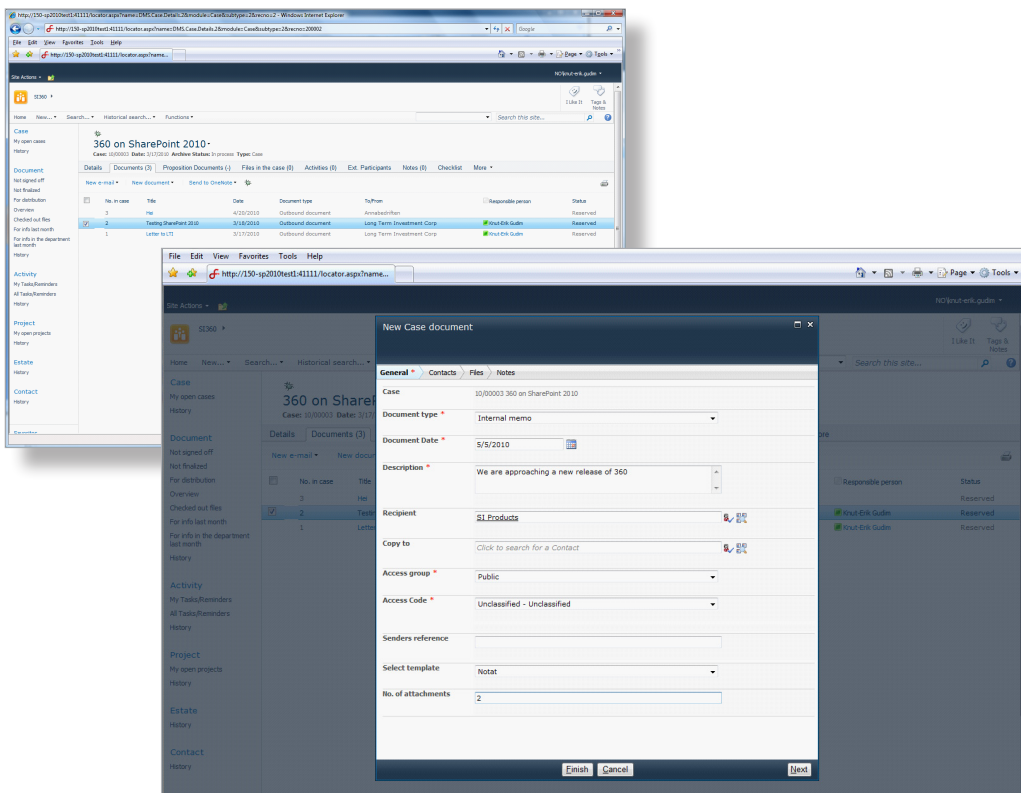

360° and ProArc for SharePoint 2010 also offer improvements and new opportunities for developers and technicians. Installation and administration has been made simpler and Business Connectivity Services allows metadata in 360° and ProArc to become a part of SharePoint's collected catalogue of metadata. It has never been easier to couple information from 360° with local data from SharePoint or other sources – this means that the information can be compared and searched for in completely new ways. For example, you can combine case information from 360° with contact information from a CRM in a collaboration room in SharePoint 2010.

Ahead of the crowd!

360° for SharePoint 2010 will be released onto the market in June 2010 and ProArc for SharePoint 2010 will be launched in the autumn. The applications continue to build on the licence-free aspect of SharePoint – SharePoint Foundation

Benefits:

- Simplified user interface
- Improved capacity for mobile and offline access
- Easier collaboration on documents
- Closer integration and even more opportunities to combine SharePoint functionality with the best of 360° and ProArc
